Editorial

Uganda National Bureau of Standards Marked
30 years of service this year. It has been a
rollercoaster period full of ups and downs but
most importantly this government agency that
started in a garage by a single woman Dr. Eva
Kasirye Alemu has evolved in one of the biggest
government Agency currently employing
over 305 staff directly and contributing to
over 18 billion shillings in Non Tax Revenue.
The Bureau also now boasts of a home of its
own on top of that all the agencies' services
are now automated which makes it easy for
Manufacturers, Importers and consumers to
access its services easily. UNBS has been
accredited by the South African National
Accreditation System (SANAS) to provide
International Organisation for Standardisation
(ISO 9001) which is a major milestone.

As part of celebrating the 30 year mark the
bureau has lined up a number of activities to
celebrate with the people including blood
donations, participating into World Food
Safety day, Quality Clinics will be held across
the country in Eastern, Western, Northern and
Central regions. .

Opening of the food safety laboratories and
lastly will culminate into the anniversary Gala
and Symposium that will honor our partners
in December 2019. We appreciate everyone
that has been part of this issue particularly our
advertisers who have not let us down.

Jovia

Jovia Kaganda

This year UNBS marks 30 years of services delivery, Quality Chronicles caught up with **UNBS' Executive Director, Dr. Ben Manyindo** who takes us through the evolution of the Bureau and his bit part of the role is has played to steer the institution into s success. Below are excerpts:

MB Thirty years of any institution is a good

So being at the helm of the institution and the celebrations, I feel that yes, it is a time to appreciate and recognize the men and women who have contributed to those three pillars. Therefore the celebration in short is about celebrating the people who have made the thirty years full of development, and the various milestones achieved during the 30-year journey, in the areas of consumer protection, trade facilitation, and fair trade practices within the market place. "It's about celebrating people."

have during these celebrations, as a way of appreciating people as you have said?

MB We have a number of activities that have been lined up to celebrate the 30 years of UNBS

The initial plan is the Launch of UNBS@30. This includes a press conference to announce the anniversary celebrations and flagging off the blood donation drive by way of giving back to our people. Other Corporate Social Responsibility Activities have been lined up including the Quality Run and donating items to selected communities during this holy month of Ramadan. The activities have been designed

to engage and encourage staff participation in the anniversary celebrations, Participating in the World Food Safety day (6th June)

A Standards Week which will include holding a number of roadshows in the five divisions of Kampala to elicit consumer interest, support for a standards culture and registration of MSMEs on certification scheme.

Quality Clinics held across the country in Eastern, Western, Northern and Central regions. The Clinics will include roadshows to generate consumer interest and appreciation for standards culture.

Opening of the food safety laboratories Anniversary Gala and

0

Symposium that will honour our partners in November 2019.

QC UNBS has achieved several successes during your time at the helm, including the UNBS Amendment Act 2013 and the introduction of e-services so people can access UNBS services electronically. But looking back over your shoulder, what would you point out as that one thing you'd say 'That is it!' and be glad to always remember you achieved if you left office?

MB That is a very difficult question. I believe that we are here to do a job and while we are here we each contribute our small contribution towards institutional development, and our very small role towards national development. It's very difficult to look and say. "This is it!" But definitely you can't be 30 years old and you are the same. You must have grown, and that growth should be judged not by us, but by stakeholders out there, or amongst us others should evaluate what we do.

UNBS was started by one woman in February 1989. But that lady also got the support of other people who thought that for a country like Uganda you must have an institution that will drive quality and standards, and more so they were looking at trade facilitation, and they knew that without an institution to drive trade through quality and standards then our trade will have issues. And indeed if you remember, in the 1990s we had issues of our fish ban in the European Union, and it made people realize that standards were very critical. Standards then began getting

The Minister of Trade & Industry, Hon. Amelia Kyambadde arrives for the UNBS@30 Celebration

a lot of support. UNBS began to grow exponentially. I remember that's when we had a big project by UNDP and implemented by NIDO, which brought in more staff, equipped the laboratories, worked with industries towards quality assurance... UNBS began to have real impact on the consumers and on the economy.

Looking back, we have come from that far to the current state. Staff numbers have grown, now we have 305 staff, while when I joined in 1998 there were 31 staff. It's not just increasing numbers for the sake, the numbers are trying to catch up with the demand for services that UNBS provides. Infrastructure has also grown. We started somewhere in Nakawa,

in a garage in Farmer's House in Nakawa, moved to EADB, then 1st Street Industrial Area, then UIRI. Now we're here in our own home in Bweyogerere. Also looking at the services we offer to Ugandans, they're very many, they have grown and diversified in scope. Our laboratories offer product testing services, audit of companies to ensure that their products are certified, system certification so that people can have confidence in the different systems (such as metrology, calibration, weighbridges, weights and measures verification, fuel pumps...) Basically when you begin to enumerate the services we do and the way we interact with the society, then you begin to find

the relevance of the institution as far as the economy is concerned, and the ordinary citizen. And the scope of our services continues to grow and widen.

Some of the milestones that I can look back at and say the bureau has registered:

1. Standards development. We have done very well on this. Not only in the number of standards, but also in the caliber of staff that this institution has produced, to the extent that some of our people, the standards writers, have moved onto regional and international jobs. At the EAC, we have had two of our staff taken on in Arusha. We have another staff now at ISO in Geneva, Mr David Eboko who has been there on UNBS' secondment for the last two years. Mr. Patrick Ssekitoaleko, who was the first Manager for Standards, now works at CODEX in Rome, Italy. And we have had many people going and coming in at the regional level. It's a big achievement to have people whom others come to recognize for their competence and get to use them.

2. International accreditation of our laboratories was a key milestone, because what accreditation does is to tell people that the competence of the laboratories and the people working in them is as good as any other elsewhere in the world. Last month we got an additional accreditation of our quality management system ISO9,000, and the Food Safety ISO 22,000 –so the certificates we give for those two are also now internationally recognised,

UNBS organized a blood donation drive as one of the activities of the UNBS @ 30 celebrations.

and now more companies are seeking to get that from us given that it is more costly to get it from elsewhere than here –and our people in that section have worked so hard in order to have us get that accreditation.

3. On infrastructure development, we are glad that we are in this building here in Bweyogerere, and that we are continuing with construction to make sure that our infrastructure actually lays a basic for the national infrastructure. The laboratories we are building are not the ordinary laboratories, we are building national reference laboratories. These laboratories will be able to service the other laboratories both in the private and in the public domain. They will be able to get proficiency testing from these laboratories, they'll be able to get reference materials from these laboratories, they'll be able to get the training of their staff from these laboratories. Also these laboratories will be focusing on

the research area, especially in terms of standardization. Those are the laboratories we are building. Of course with time we'll continue giving the ordinary testing services, but ultimately we are looking at them being reference laboratories for this country, which is part of the required national quality infrastructure if this country is to continue trading, especially the export business.

4. We have also now flagged off the decentralization programme. We intend to build a mini-UNBS' in each of Gulu, Mbarara and Mbale towns to replicate there what we have here at the headquarters. We look to have at those centres some laboratories, some market surveillance, certification, meteorology, name it. This is primarily because one of the challenges we have now is accessing the laboratories in Kampala if you're from upcountry. Imagine someone from Yumbe

>>>>>>>>CONTINUED ON PAGE 8

coming to Kampala bringing a sample to be tested, then going back and waiting. We're trying to take services nearer to the people. We have some support which will be coming through Trademark East Africa to help us with that, and we're working with them closely on that.

QC We have grown as a country in manufacturing and exports, and UNBS plays a key role in this sector. When you look at our attempts to achieve favourable BOP, achieving a good ration of what we export Vs what we consume, has the bureau UNBS played a critical part in aiding/facilitating trade, esp. the exports?

MB Yes, UNBS has played a very big role. Unfortunately we haven't quantified, and that's the direction we are trying to go. For now it's just on paper without figures, but still if you look at the exports and break down per region, you'll find the exports to EAC and COMESA form a big percentage of exports. More so for manufactured goods -most of these, more than 85% of these, are going to the region, and to go to the region you must have certification, you must have the Quality Mark, otherwise you don't cross. That's the value we're adding as UNBS. We're now trying to capture how much exports with the Q Mark we're exporting as a country -though it is proving at times difficult to get these from the manufacturers. If, for example, a given company is exporting steel to Rwanda, Kenya, etc, an EAC country that recognizes the Quality Mark, we are trying to find out how much exports with the Q Mark they're exporting. Because

without the Q Mark it might be difficult to export those products, they'd perhaps only export a small percentage of the total they're realizing with the Quality Mark.

Some exporters find it difficult to have their products tested, so they try to export them without being tested, then they get intercepted and they're locked out or captured and are destroyed. So we're trying to make sure the goods going out meet the requirements of the other market where they are going, not necessarily just our own standards requirements.

QC What future plans do you have for the bureau going forward? You always have a plan, previously you had the 5-Point Programme?

MB It is primarily building onto what has been done. We have not yet really done the foundation that I'd have liked to see personally, because the laboratory infrastructure which is critical for this country is not yet there. The Food Safety Laboratory is okay, but we're lacking the National Meteorology Lab and the Engineering Lab. When those two laboratories come on board, we'll have in place 85% of the national infrastructure we need as a country. The other 15% will be provided by the private labs, industrial labs and so forth.

Two, is the issue of taking services nearer to the people, and the bureau providing those services with efficiency and effectiveness, not someone having to wait long for a month for results to come out of the laboratory, or waiting for the ED/Deputy ED who are out of office to clear their goods. We

must have efficiency across the board.

Three, we must invest in our people if we are to realize our targets. We must invest in our staff in terms of technology, in term of professional development. That is key.

And like I said, we must utilize technology to drive our processes going forward.

-All that said, we're going for NDP (National Development Plan Phase 3), because Phase 2 ends in 2020. Right now at the national level we're beginning to plan for 2021-2026, and as government agencies we have to align our plans with the National DP. For us the alignment is going to look at service delivery, I believe this is going to be captured in NDP 3. Use of technology and therefore investing in technology is going to be key for us, because at the end of the day it is service delivery, it's about economic and social transformation of the country, we must make our contribution on that. Oil and Gas will be coming in about 2022/2023,so we've got to factor in how that will play in the economy. So far we have worked on the standards for the sector, now we're looking at the measurement side. How will you measure the oil that will come out at the different levels, in the pipeline, the dynamics of that is important. We must factor in Oil and Gas as we're planning, but we must also look at how we get our people from the current state to Middle Income Status. How do you help SMES grow, create jobs..? There are the global/external factors to consider too. We're definitely going to be on the same mandate, but maybe different

focus. We have to sit with different stakeholders and agree on the way forward.

QC Now talking about Oil and Gas and Metrology, UNBS is enjoined to administer/oversee the Weights and Measures Act. Won't it be too much for you to bite, having this department centralized under one institution UNBS? For example, in Kenya and in Tanzania, this department is independent as Kenya Weights and Measures, same in Tanzania. Probably in future you look to ask to let it be a department of its own?

MB We've had that argument before, there was even a consultant who came to guide

us on how things should be done, and there are also experiences from elsewhere. Writing standards alone without doing anything else is work of a complete institution, quality assurance certification is also work of its own institution, testing the same, but what we have done is we have put all those under one institution and it's beginning to be heavy. But it's also a good thing, because many of these things wouldn't grow under their own separate institutions. My thinking and prayer and advice is that we should be careful how we release certain things off UNBS. Weights and Measures used to be under the Ministry of Trade, until 1992 when the ministry found it too heavy and gave it to

UNBS, even appending it to the Standards Act that UNBS will have to administer it.

Now, meteorology is a big, big thing, competing with standards. There are four pillars of quality infrastructure if you look carefully: standards, metrology, and accreditation. Those are supposed to be stand-alone institutions and going forward that's how it should be. When the bureau grows, you release certain things to other agencies or to the private sector. But the challenge we have now, government doesn't want to create other agencies, it's collapsing or merging agencies.

PVoC FOR VEHICLES RESUMES.

NEWLY IMPORTED CARS TO BE FREE FROM INNIAL INSPECTION FOR ROADWORTHNESS

John Paul Musimami is the UNBS Deputy Executive Director (DED) –Compliance. He spoke to Quality Chronicles about UNBS’ journey to resuming the pre-verification of vehicles in their countries of origin, an activity that had come to halt last year but gets to resume this year (2019).

QC The public has heard a lot of rumours regarding Preverification of conformity (PVoC) of vehicles being imported into Uganda, some claiming that Uganda stopped doing PVoC altogether, some that Uganda had changed from doing PVoC in the vehicles' countries of origin to

exclusively doing it locally, others that nothing has changed...clarify what exactly is going on.

JM We've had PVoC since 2013, and we are still having it. The only issue is that while from 2013 to last year we were doing PVoC in the vehicles' countries of origin, before the vehicles came to Uganda, since last year we have been doing it locally, on vehicles after they arrived in Uganda. This is because the contracts we had with the companies that were doing for us PVoC in the vehicles' countries of origin expired, and we have had issues renewing them, issues in form of conflicts within and with the companies that have

been providing us with the service. We couldn't legally sign new contracts with service providers in time, so we have been temporarily doing PVoC locally, after vehicles arrive in the country. But we have finalized contracts with new service providers to resume doing PVoC in the vehicles' countries of origin.

QC What exactly where the issues of conflict between UNBS and with the service providers that made it impossible for you to immediately renew the contracts with the old service providers/ What's that story?

JM We had three companies doing PVOC --Jevic, Jabal and EAA. When contracts came to an end, we had issues in court, where Jevic had run to court arguing that at the expiry of the contract they were supposed to become the only company providing pre-verification. This was because in the terms of the old contract that ran from 2013 and ended in 2018, Jevic had been given exclusive rights to inspect Ugandan-headed vehicles in Japan, and then somewhere along the way other companies had been brought on board. Jevic contested, went to court, and there was an arbitrary award of them being given exclusive rights upon the expiry of that contract which expired in May last year. This was in the High Court here in Uganda. We were either to give them exclusive rights, or pay them an amount equivalent to what they were scheduled to get over the duration of their contract as exclusive service providers. With that award by court, as the contract drew to

close, we formally went through the procurement process to have Jevic as the only service provider –much as the contract had been awarded by court, we had to go through the procurement process, through PPDA, to grant them that contract. We had negotiations, discussions, generally set about sealing everything.

But before we finalized to award the contract, Parliament came in questioning why we were awarding only one company. They argued that Jevic were incompetent. There was an investigation set up by Parliament and UNBS was duly notified, so the procurement process we had undertaken came to a halt. It took us some time to figure out what to do.

QC So what exactly did you do now that the contracts with service providers couldn't be renewed? What happened during the interim period when the PVoC was halted, as you sorted out the issues you've explained?

JM What we did in the interim, we tried to do verification locally right at the point of destination, as soon as the vehicles got into the country. We set up the facilities that we have been trying to use to do PVoC locally. But we didn't really have the capacity, in terms of equipment. And in terms of the numbers too, we didn't have enough people, the inspectors were overwhelmed by work. To the extent there were a lot of complaints, much as we were charging USD 140. There was also the issue of value for money, we lacked equipment in addition to the lack of numbers, so we weren't really giving adequate services to the public/country. It

was clear we quickly needed to get this once more done outside there at the point of origin, before the vehicles come in.

So we had to find a way of acquiring the legal permission to find someone to do for us PVoC in the country of origin on a temporary basis, while we worked to find a permanent solution.

QC And we have heard that as UNBS you reached an agreement to pay one of your former service providers, Jevic, in order for you to be able to sign on new service providers both for the temporary period and for the long-term?

JM When we got to the Solicitor General he said, "I see the contracts you have prepared, but there is the issue of Jevic which is yet to be solved, how are you solving it? So we had to come back and sit and negotiate with Jevic, to pay them in eight installments the equivalent of the arbitrary award, over three years from July 2019 till 2021. There were a lot of negotiations between Jevic and UNBS, chaired by the Ministry of Trade, Industry and Co-operatives, under the auspices of the Permanent Secretary (the late Julius Onen took part, and when he was away sick one of the commissioners who took over the activity was Ojakol). So the ministry led the negotiations and the Solicitor General's office was also on board with us. Once we had secured the agreement, we signed the consent agreement with Jevic. UNBS people were in Japan regularly solving this issue with Jevic, and we signed the consent agreement with them. It was (the consent agreement)

One of the things is that if the vehicle comes in, it will of course have the date of inspection on the sticker, meaning it fulfilled UNBS standards, so it has one year to operate without being inspected again because they have been inspected by UNBS and they don't need the Ministry to inspect it over that one year, for UNBS and the ministry use the same standard to inspect.

filed/registered at the registrar's office. We forwarded the signed consent agreement to the Solicitor General, and he Okayed it. The Solicitor General gave us the green light to proceed with the process of securing contracts for the interim. After that, we came back and invited EAA and Jabal to come for the signing of this agreement, so that we can have the resumption of Preverification of Motor vehicles as soon as possible, and it is resumed on the 15th of March 2019.

QC How come the previous Law/regulation still didn't envisage the part of spare parts as well?

JM It was an oversight. It is something that has just come to our knowledge recently, I don't know how/why it escaped us. But now we're focusing on it. Interestingly, in Kenya it is something they've been working on all through, but for us it wasn't

>>>>>>>CONTINUED ON PAGE 14

captured. I think the issue was there being so many thousands of spare parts which would mean having/drawing so many different standards, making it a challenge to say which standard are you going to begin with/implement. That's why for us now, in this specific aspect of spare parts we're saying spare parts but all confined to the area of radiation with focus on radiation, to at least ensure that all spare parts coming into the country are radiation free, because radiation is radiation.

QC We know that in Uganda we generally import from specific countries. Japan South Africa, Singapore, Dubai... The greatest number of the total

volume of reconditioned vehicles coming into the country is from Japan. Are the two inspectors you're signing to do PVoC spread in those two main countries we import vehicles from?

JM Jabal-Kilimanjaro is there in Dubai, so Dubai market is taken care of. EAA is based in Japan where majority vehicles come from, while they're also in Singapore. South Africa I'm not very sure, but I think it's being handled. But the agents have put a lot of effort in Japan where we get our majority cars from, so they're ideal. They're also in UK, and in several other countries.

QC There's a recent regulation to be implemented by URA which says there's a threshold on the number of cars from a single manufacturer that can come into Uganda, and anything that exceeds that number shouldn't be let in. Is this in tandem with what you're trying to implement? Or if there are any disparities, how can they be addressed to reconcile them?

JM Normally we issue administrative notices to improve on the effectiveness of the programme, be it for vehicles or general goods. 1) Those people have a standard of 2018 which they're implementing, but besides that they also have to the issue

of year of manufacture as far as the Uganda market is concerned currently, so it's something again we brought to their attention for them to take into consideration, because you are a government body and this is a law which was passed by government, so you continue inspecting and allowing only cars which fall within that age bracket.

QC The public doesn't seem to see the difference between PVoC and continuous assessment of roadworthiness. we have had complaints from the public on the radio, TV, in print, people saying that there are different inspections everywhere which is bringing a lot of confusion, what is it the public needs to know?

JM The public should/needs to know that UNBS is in charge of products that are imported into the country where there are mandatory standards, and vehicles are part of these products. So by default vehicles

fall under the category of products which UNBS should be regulating when they're coming into the country. Once inspection has been done, there's a sticker put there to show that this vehicle was inspected. What we were telling people (thanks be to God even the contract between Min. of Works and SGS is being reviewed and UNBS is part of that committee). One of the things is that if the vehicle comes in, it will of course have the date of inspection on the sticker, meaning it fulfilled UNBS standards, so it has one year to operate without being inspected again because they have been inspected by UNBS and they don't need the Ministry to inspect it over that one year, for UNBS and the ministry use the same standard to inspect. Thereafter, when the one year has ended, since it is inland, it is subjected to the law which is being administered by the ministry of Works, which requires the vehicle to be inspected annually

Patricia Ejalu UNBS Deputy Executive Director-Technical at the UNBS @30 Celebrations

for roadworthiness. After the one year, the validity of the stamp it received from UNBS expires, which triggers the responsibility of the owner of the vehicle to ensure that it is taken to these other inspection facilities set up by the Min. of Works and Transport, either at Police or SGS. It is incumbent upon the vehicle owner, upon the expiry of the validity of that one year stamp it received from UNBS while entering the country, to take the vehicle for internal review under Min. of works. The difference then is that it's not the Min. of Works' responsibility to look at vehicles coming inside, that's UNBS's role, the Min. of works takes over once the vehicles are here.

Eng. Masitula Munyaami Male, Chairperson

Dr. Ben Manyindo, Executive Director, Secretary to the Council

Mr. Afidra O. Ronald

Ms. Mary Sepuya

Eng. Peter Balimunsi

Ms. Daphne Rutazaana

Dr. James Kaboggoza Ssemwanga

Mr. Kachope-Kato Benedict

Prof. Jackson Mwakali

Mr. Al-hajji Lule Umar Mawiya

The Minster of Trade, Industry and Cooperatives, Hon. Amelia Kyambadde, appointed ten members of the 8th National Standards Council (NSC) for a period of three years. The NSC is the supreme governing

body of UNBS that is responsible for providing oversight and policy guidance to management to ensure effective service delivery. The council is responsible for approval of draft standards as national standards.

The ten members of the Council were sworn in at an inauguration ceremony at UNBS Head Office in Bweyogerere. Hon. Kyambadde congratulated the Chairperson and members for their re-appointment to serve on

UNBS Board for the next three years. She noted that there were delays in appointing the NSC because of the proposed restructuring of government agencies. “The delay in the appointment of the 8th NSC was due to discussions within government on the restructuring processes of Departments and Agencies but due to the critical nature of the Council in the implementation of UNBS mandate, Cabinet agreed, after consultation with the Attorney General, to reappoint the 8th NSC,” Hon. Kyambadde added. Hon. Kyambadde acknowledged the achievements and challenges of the 7th Council as detailed in their report and encouraged the members to find innovative ways and solutions to resolve them. “I would also wish to see better policies and strategies put in place in supporting various Government programs and the private sector while delivering UNBS

services,” she said. In her inaugural address, the Chairperson of the National Standards Council, Eng. Masitula Munyaami Male pledged to work with Government and UNBS management to ensure that the institution delivers on its mandate.

NSC Members Include:

Eng. Masitula Munyaami Male, Chairperson

Dr. Ben Manyindo, Executive Director, Secretary to the Council
Prof. Jackson Mwakali
Mr. Afidra O. Ronald
Mr. Al-hajji Lule Umar Mawiya
Ms. Mary Sepuya
Mr. Kachope-Kato Benedict Abooki
Dr. James Kaboggoza Ssemwanga
Eng. Peter Balimunsi
Ms. Daphne Rutazaana

OVER CONSUMPTION OF ALCOHOL IS INJURIOUS TO HEALTH

ISO PC 318 TO GREATLY IMPROVE COMMUNITY SANITATION

COMMUNITY-SCALE SLUDGE TREATMENT SYSTEM
DEVELOPED BY UNBS & WORLD HEALTH ORGANIZATION.

Sewer lines, or lagoons, have for long been the only communal sludge management system in Uganda, where the sewer lines draw the sludge from all over the city and take it all the way to a mass collection and treatment centre in Bugolobi or Ggaba.

ISO PC 318 is a project that aims to change that, as it is working to come up with a system where the waste of smaller communities, of say 1,000 or 2,000 people, is collected and treated within the small community itself, without transporting the sludge to far-off mass-handling centres as is the case with sewer lines.

Aiming at proper and even productive treatment of communal sewage

Mr. James Aracha, from the UNBS Standards Development Department, explains that the whole idea is to help communities have better and more productive treatment of their waste than is the case presently.

“Many times in Uganda we have the sewer lines overloaded, so having small communities treat their own waste will relieve the sewer lines significantly. Then there are those communities which can’t be connected to the sewer line easily, such as some

Mr. James Aracha
UNBS Standards Development Department,

upcountry towns. ISO PC 318 should come in handy for these ones, as it will provide a standard for them to develop their own local waste treatment mechanisms.”

“We are also looking to having the communities significantly benefiting from their own treatment of their waste, by having the system make use of the treated waste in ways which have scarcely been used here, such as using it to generate power and making out of it high quality manure, things that are being done in countries like India and Brazil. Even the local environment is saved when there is proper treatment of waste right at community level.”

Mr. Maracha says that the project is in line with helping Uganda to realize SDGs, which is about securing access to clean water and

sanitation for all people by 2022.

A global project that's the brainchild of WHO

Senior standards Development Officer Mr. Maracha explains that PC stands for project Committee, and says this means that ISO PC318 is a time-bound initiative that's having different stakeholders from diverse places and backgrounds working together to achieve a common goal.

“There was a research that was done by WHO a couple of years ago, and it was estimated that about 2 billion people use latrines that are not properly managed. In the same report they estimated that 1 billion people around the world have no latrines, leaving them with no choice but to defecate on the open ground.

After that report, the Bill and Melinda Gates Foundation took interest and said since there's this challenge, why not go ahead and make standards for that area where there is a challenge? So this standard is being developed by experts all over the world, but being funded by Bill and Melinda Gates Foundation.

“Like any other international project focusing on a global problem that cuts across countries, the project started with WHO organising an International Workshop Agreement, which is a bringing together a number of experts in the field in question, in this case experts of the sanitation world. When the experts come together they develop a working document and constitute a project committee which begins improving the document to become a standard, and it is at this stage that they work with different countries to develop the standard. The experts developed the working document and the project committee, coming down to working with countries. In Uganda they got experts to work with UNBS to develop

the standard because UNBS is the national standards body of Uganda.”

Complements the household-focused sewer-management standard that was developed earlier

James Aracha explains that the community-focused ISO PC 318 is

being developed to complement the Pre-fabricated, Non-sewered Sanitation System that UNBS has already developed to help individual households treat their own waste without connecting to the sewer line.

“We had a committee that developed ISO PC 30500 over the last about four years, which is Non- sewerd sanitation

>>>>>>>>CONTINUED ON PAGE 20

According to National Water & Sewerage Corporation, New sewer line will serve 380,000 pple, treat 45 million litres of waste water from Nakivubo channel . Photo credit: NWSC on Twitter

system, which was published last year in October,” James Aracha explains. “That system was meant for individual homesteads, their toilet systems, to treat their waste on spot before it is dumped away or removed for other use or resources, without connecting to the sewer system but With ISO PC 318 we are developing a similar system or standard, but now on a larger scale, for the community rather than the individual household.”

“The household-focused ISO PC 305 was developed and completed at ISO level, that’s why it has come to our national level. The way these standards work at ISO level, they are developed first at ISO level, to establish a general standard that should cut across the world, then individual countries begin to adopt the standards as they see fit or make them feasible in their own environments. We start at ISO

level, and then keep reducing till our national level. It is up-bottom, not bottom-up. Because we might develop something and you find it’s not working for Uganda, most especially with product standards, we have different regions of the world, what works here may not work in another country...”

Mr. James Aracha says it is important to understand how different the pre-fabricated non-sewered sanitation system is different from the septic tanks that we already have here.

“The difference between this and the septic tank is that it’s something you can test and see the performance and everything. But the septic tanks we have now, they’re failing. You move around and the smell is all over, you go to a building and they’re leaking everywhere. The septic tank we’re designing in residential places/homes isn’t functioning as it is

supposed to be. Experts will tell you, you need enough space for the septic tank to work well, but now we’re squeezing, imagine you have a 50 by 100 and you’re digging there, your soak-pit is within someone’s perimeter, it’s like you’re just putting a basin there to hold something, but that fecal sludge isn’t being treated and can be a big problem. That’s why when it rains, you find everything is flooding and it’s dangerous to health (cholera). That’s why they’re telling you this fabricated one, you put it somewhere there, maybe behind your cottage, the waste goes in, is treated, and when comes out it can be another resource somewhere. Because the septic tanks don’t treat, you have to bring trucks to empty and take it for treatment. But now this one treats right there, what you get out is well-treated.”

“We are also looking to having the communities significantly benefiting from their own treatment of their waste, by having the system make use of the treated waste in ways which have scarcely been used here, such as using it to generate power and making out of it high quality manure, things that are being done in countries like India and Brazil. Even the local environment is saved when there is proper treatment of waste right at community level.”

Project is at half-way stage of development

The UNBS Senior standards Development Officer says the project is somewhere around the halfway stage of the about three years it’s supposed to take, depending on the responses from stakeholders,

“When you don’t meet so many challenges, an international standard like that normally takes about 3 years to be completed. It started last year, around April is when they started doing ground work.

“It’s had one meeting so far, the International Workshop Agreement, where they call experts, like in this case experts who are in the sanitation world. These experts develop a working document, then they come up with a project committee. They then begin improving the document to become a standard. Here they begin involving

other stakeholders. When they’re calling for International Workshop Agreement, they’re just calling experts. After they develop the working document and committee, they work with countries, you register as countries such as Uganda --when you talk of Uganda the national standards body of Uganda is UNBS, so they get experts to work with UNBS, to develop the standard itself. The process of developing the standard, following the International Workshop Agreement, started. So far they’ve had one meeting of the Project Committee (PC), last year in France, Toulouse. This one going to be in Uganda is the

second meeting.”

Implementation will have to be done by bodies like KCCA and other town/ municipal councils

James Aracha reveals that the role of UNBS in this case is to develop the standard, then leave the implementation to the stakeholders charged with that, whom they have already involved to know what they are developing.

“There are other agencies and stakeholders charged with implementation, like KCCA, that’s their role. For us we develop a standard and it is up to them to find a way of implementing that

interconnectedness. In the case of UIA and UNBS, many of the investment projects the former registers are also key for the latter.

In the OSC, the agencies form a crucial ecosystem that works seamlessly to promote and facilitate business and investments in Uganda, both domestic and foreign. The OSC is a hive of activity with primary investment services on offer.

A critical link between UIA and UNBS is in the area of manufacturing. In financial year 2017/18, the Manufacturing sector registered the biggest number of licensed projects, 125, which accounted for 51 percent of all the licensed projects.

The import is that most, if not, all the 125 manufacturing projects have to deal with UNBS too, because, on the one hand, The Use of Distinctive Mark Regulation 2018 makes it mandatory for goods covered by compulsory

standards to be certified before they are allowed on the market.

On the other hand, one of UIA licensing requirements is for a licensed investment project to fulfil all necessary regulatory requirements, including certification of standards, pre or post licensing.

The strong inter-agency link saw UIA allocate to UNBS a sizeable chunk of land in Bweyogerere Industrial Estate on which it (UNBS) built its headquarters and labs. It was the smart thing to do because UNBS is now situated right in the middle of industries.

Likewise, UNBS plays a crucial role for UIA, especially in its facilitation and aftercare efforts like enabling licensed investors get standards certification. The long and short is that UIA and UNBS are on a winning collaborative path which benefits the country.

UIA, like UNBS, started small and

is now a significant player in the realm of investment promotion and facilitation. Since 1991, when UIA was established, it has licensed over US\$24 billion in planned investment projects. This is no mean achievement.

The New UIA, armed with a new Investment Code (new mandate), new Board of Directors and new structure and agency, things can only get better and better.

Going forward, the collaboration between UIA and UNBS will only get deeper and better, with great possibilities like automation and technological interfaces so our common clients (read investors) get the best experiences possible.

The UIA Board of Directors, Management and Staff congratulate UNBS upon its 30th anniversary and wish it even greater successes in the next 30 years.

aspect. Our mandate is to develop what's good for the community, and then the enforcement authority finds how to implement or enforce. At least we shall have done our part," Mr. Aracha says.

However, the UNBS Standards Development Senior Officer is hopeful that the standard will be picked up by different communities because they have engaged the would-be implementers in the development process right from the start, and he also says there are already several municipalities and town councils that have expressed interest in it.

"We've involved the different stakeholders who're concerned with this product, like people of Ministry of water, NWSC, KCCA. We've been involving all of them so that they're aware of the development that's going on, and for their input also. They

have been participating in our meetings, they're aware of the project and what's going on. One of the site visits was done at NWSC in Lubigi."

Mr. Aracha says if contacted UNBS will actually help design for some of these communities something that can treat for them their waste without necessarily connecting to the sewer line. This is what this standard is looking at.

Mr. James Aracha allays fears that the standard may not work in some areas due to the fact that communities are different in outlook and structure and how they behave. He says that the reason it is called a global standard because it is designed to work anywhere.

"During the development, they consider all factors, how communities differ, how they will

accommodate the standard...We normally set the minimum which should be accepted, minimum acceptability is the key here."

2nd Meeting of the Project Committee was held in Kampala

The second meeting of the project Committee that's developing the standard was held in Kampala in April. According to James Aracha, over 100 sanitation experts from all over the world met at the Serena Kampala Hotel for a week, sharing what they've got from research over the months since the first meeting, and then generated opinion towards building the working document further.

"What happens at ISO when they're developing this standard, documents are shared prior to the meeting, and people generate comments when they come together. People are given time to do their research, when they meet they know what they're talking about. The whole idea is for different people to present their takes, with a view to building one single position. People from academia, industry, medicine, name it...they all converge and put their knowledge together to come up with a standard," Mr. Aracha explains.

At the end of the meeting, the experts had a field study to see actual sanitation challenges on the ground in Bwaise slum. They had a look at pit-emptying technologies, as well as Transfer Tank Technology that's being piloted by Water for people.

weighbridges run according to standard).

Specialised unit to handle weighbridge verification

Explaining that when there is no body going around to verify their genuineness weighbridges (like all weighing equipment) can actually be manipulated to commit corporate fraud, Mr. Ebong reveals that UNBS through its Executive Director made a decision last year to set up a specialised unit and get an entire operational system in place to handle the verification of Weighbridge.

“There were a lot of outcries from the public, people saying they were being cheated,” Mr. Ebong reveals. “These came from all sorts of areas where weighbridges are used in Uganda – farmers who sell large quantities of produce to factories, such as sugarcane and coffee farmers; importers who bring merchandise through border points, wholesale traders who buy from factories in bulk; clients of stone crushers in quarries; among others. Even us at UNBS, we saw some of these things out there in the field: you found a weighbridge where only the operator could see what he was doing while hidden behind a wall, and you realized there was no fairness guaranteed to the client whose goods they were weighing to do business with.”

The Manager of UNBS’ Legal Metrology Department explains that from September last year the national standards body, working jointly with the National Metrology Laboratories, has been going about efforts to operationalize

an efficient unit that does weighbridge verification.

“We have established the team that will be fully handling weighbridge verification, moving around the country, going for emergency calls, doing routine inspection as is required. We trained a group of ten staff drawn from National Metrology Laboratory and UNBS’ Legal Metrology Department, gave them examinations and when they passed we deployed them to handle the task at hand,” Mr. Ebong reveals. “We are working with National Metrology Laboratories because by Law they’re supposed to do the calibration, then after we come in and do the verification, and after doing the verification (after an inspector has verified equipment) seal so that no other person can tamper with the verified weighbridge.”

“We have acquired a new truck, we are finalizing the procurement of 60 tonnes of roller weights (the weights UNBS uses as a reference to verify the accuracy of the weighbridges it inspects).”

The process of weighbridge verification

Mr. Ebong explains that so far, they are only dealing with people who are voluntarily asking UNBS for verification, while they develop a framework which will by law require everyone to have their equipment verified.

“People send in their requests to UNBS to go do the calibration and verification, and we send them teams to do it,” Mr. Ebong says. Many clients have been doing this voluntarily.

“We are establishing an inventory of all the weighbridges that are in the country, so that we can develop a framework by which we will regularly verify them, because mandatorily we’re supposed to verify at least once a year, if anything even twice a year.”

The process takes different steps as Ebong explains “Verification has got many processes. First, examination, to see the completeness of the weighing equipment, in this case the weighbridge. This is to ensure all parts that the machine should have are in place. When we examine and find there’s something missing, we don’t even go the next step, which is testing. If you’re fine upon examination, then we test, seal, stamp and then issue a certificate.”

There’s an established margin of error which the law allows the equipment to possibly have, we don’t about their not looking for 100% perfection. When we come to verify we check and see whether the machine’s shortcomings fall within this accepted error margin, then we rule the machine as passed or failed depending on this. It is called ME, Maximum Permissible Error, and it set within acceptable limits. If the fault in your weighbridge spreads outside the ME, then we can’t verify your machine, it has to be corrected. When your weighbridge fails, you’re issued with a rejection, and advise you to get someone to repair it for you. After the repairer has fixed the machine, then we should be called in to verify, because even the mechanic should be able to repair the equipment to regain its original accuracy or within

that accuracy. If you can’t bring it within that, then that weighbridge should be decommissioned. Some weighbridges are too old and should simply be decommissioned.”

Mr. Ebong reveals that regarding the entire process of verification, UNBS is developing a system called E-minzani, which should create an inventory of all measuring equipment in the country and their condition, so that when they visit a given weighbridge they can be able to know that “the last time we came and verified this weighbridge was in such and such a condition... there was an error coming from such a point, it was tested by this inspector, repair was

done by this person/mechanic...”

The difference between calibration and verification

Mr Ebong says there’s need to note that calibration and verification are two different things.

“Calibration is all about coming up with the performance of the machine, and letting the owner know that ‘There are errors or not.’ You show them the margin of error, tell them to include this error in your calculations. There’s no need to seal. Verification now includes protecting even the person who hasn’t been there when we calibrated, who doesn’t know the performance of the instrument. We say, ‘This is the

limit, beyond this you can’t use this instrument, you’ll be cheating the public.’ We go deeper into fraud to see how it can be manipulated once we are away. On calibration we don’t seal, on verification we seal.”

Most Ugandan weighbridges have been faulty

Peterson Kiguli, a filed officer in UNBS’ Legal Metrology department, has been involved in the new efforts of weighbridge verification right from the start. He reveals that they have found most of the weighbridges they have visited so far to fall short of the standards.

>>>>>>>>CONTINUED ON PAGE 30

Blended and packed by: BRIGADE DISTILLERIES LIMITED
 Plot No. 165, Kawempe, P. O. Box 70577, Kampala, Uganda
 Tel: 0776 989 896 / 0776 989 897
 Email: brigadedistilleriesltd@gmail.com

“There are two areas where two areas where most weighbridges have failed upon examination, two main features where we have found the weighbridges lacking or faulty,” Mr. Kiguli says. “First is a lack of legally relevant parameters, things to do with lack of external displays. Most weighbridges have been having one indicator, the operators’ indicator, yet they should have more than one indicator so that even the client is able to see what is being done. This means if a client brought goods on a truck, they wouldn’t see what the operator inside is viewing, yet the client should also see, for transparency, and because it is actually a legal requirement that there should also be an external indicator, so a client isn’t just on the operator’s mercy.”

"Secondly, we have also found that most weighbridges around don't have sealing provisions for metrological control parts. There are those specific parts which we know if someone accesses they can easily manipulate results, those parts are subject to sealing. But most of the weighbridges we have inspected, we have found there's no sealing provision. We have found that by design some weighbridges aren't supposed to be used for trade because some features aren't incorporated, such as metrological switches on the circuit boards—that's a bit too technical, so let's say there are some components we look out for on the circuit boards. There are some weighbridges that have disparities, the motherboard is different from the representation on the document, so you have to look at the document and check

The UNBS weighbridge verification team at work

to see what is on the document tallies with what is on the inside of the equipment.”

Kiguli reveals that so far, they have looked at 20 weighbridges in different parts of the country, but only 2 of the 20 have met the minimum standards for verification.

“One is in Kasese and the other is in Hoima.”

Timelines within which to fix faulty weighbridges

Mr. Kiguli reveals that when UNBS finds a weighbridge short of standards, they recommended to the owners what to correct so their machine can be verified, however they will apply an iron hand on those who refuse to fix the problems pointed out to them.

“A weighbridge owner has to get verification reports from us after we have come and taken their machine through the process. In that report we put recommendations, what one has to implement, and we give timelines ...

“Because what’s been happening was that people didn’t know what they were supposed to do, we are giving them a grace period, say six months, within which they should have rectified. But if after the given grace period we are to go back and they haven’t rectified, we will take them as stubborn or intent on cheating, and the Law has penalties for failure to comply—in some instances you may even be imprisoned for 3 or even 5 years.”

We shall move to automatic wares after weigh bridges

Issues we've handled have also included energy meters such as Yaka, when the system was new there were issues and we had to guide them, correct this and that, include this parameter etc

Maybe I can say we will be moving towards automatic wares. These are the ones which package goods; they're programmed, say, to pack 100 kg, or 1 kg per given pack/container.

The Minister of Trade and Industry Hon. Amelia Kyambadde flanked by the New Standards Council unveil the new UNBS ISO certification Mark

The Uganda National Bureau of Standards (UNBS) has been accredited by the South African National Accreditation System (SANAS) to provide International Organisation for Standardisation (ISO) Management Systems Certification.

The accreditation comes at a time when a growing number of Ugandan companies are seeking ISO management systems certification to benefit from the nascent oil and gas sector.

According to ISO, a management system is “the way in which an organization manages the inter-related parts of its business in order to achieve its objectives including, among others, product or service quality, operational efficiency, environmental performance, health and safety in the workplace.”

The SANAS accreditation means that UNBS is now internationally recognised to provide certification services to organisations for Food Safety Management Systems (ISO

22000) and Quality Management Systems (ISO 9001).

UNBS joins acclaimed multinational service providers of ISO management systems certification that comply with international requirements.

The UNBS Executive Director, Dr. Ben Manyindo said: “The accreditation means that UNBS has been accepted and recognised at international level to offer ISO management systems certification in a competent, consistent and impartial manner.”

“This accreditation will give Ugandan companies an opportunity to certify their organisational systems and processes at an affordable cost to demonstrate that their services meet international standards and therefore capable of meeting customer expectations,” Dr. Manyindo said.

“The certificates issued by UNBS are now recognised worldwide thereby facilitating international

trade. It gives us a competitive advantage in a market dominated by large foreign multinationals. We intend to use this accreditation to expand our market share of ISO certification,” Dr. Manyindo added.

This accreditation adds to the UNBS chemistry and microbiology laboratories which are internationally accredited by SANAS.

SANAS is a signatory to the International Accreditation Forum (IAF) which gives it world-wide recognition as a competent body for carrying out independent evaluation of certification bodies against recognised standards. International accreditation agreements provide a mechanism that allows accredited certificates to be accepted around the world which reduces the risk of products and services being rejected in international markets.

QUALITY CHRONICLES

QC How is the enforcement going to be, how are you going to enforce this, now that you have agreed at the East African Community level to use the Distinctive Mark, how is it going to scale away the S Mark and how are you going to enforce

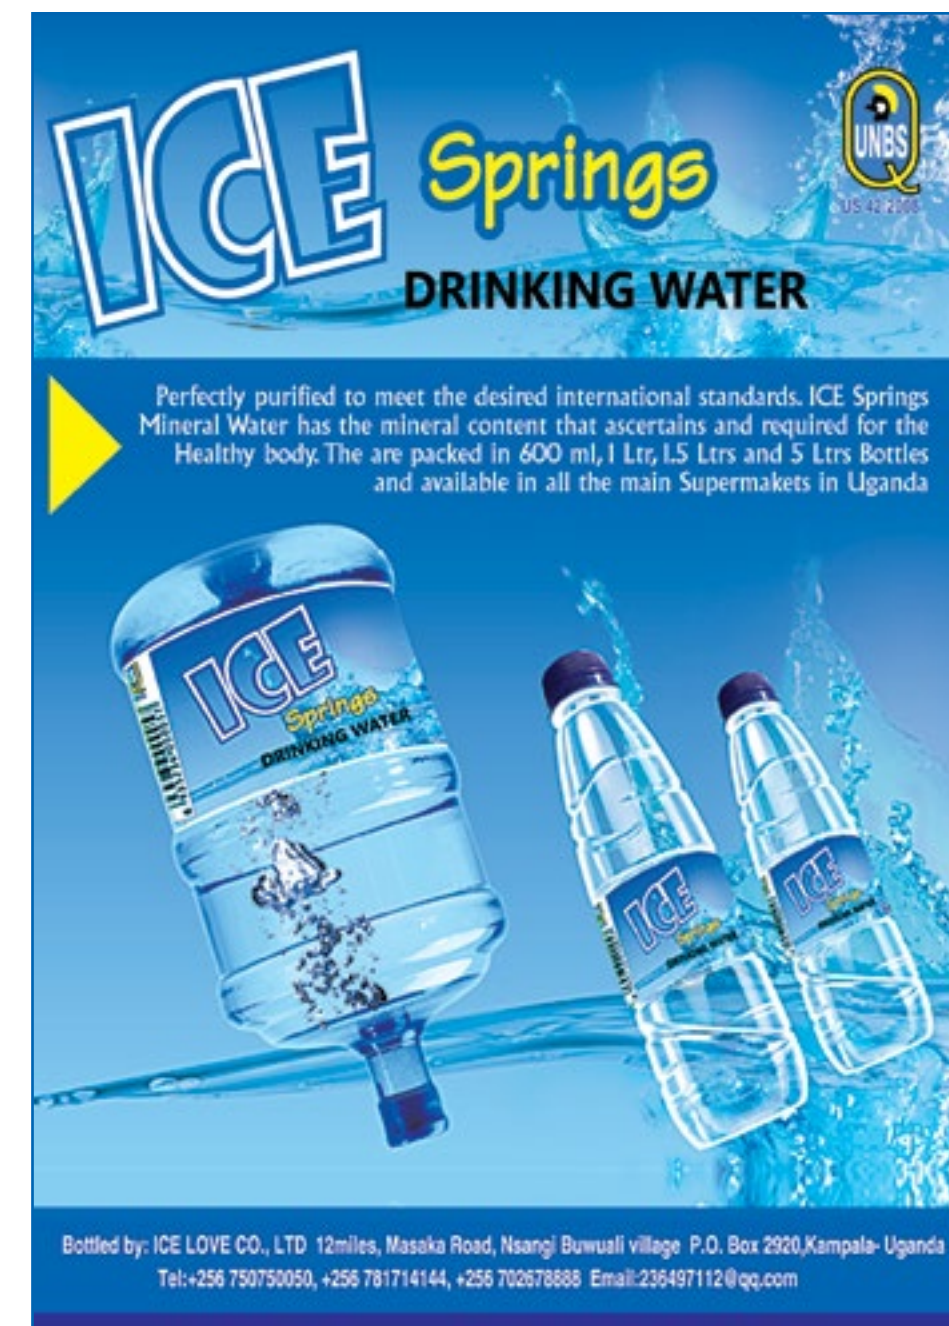

their consumers. So people were coming in here voluntarily. There are also those who have been in the manufacturing of local products and they never bothered to come for certification. Now we're telling them that once a standard has been declared a compulsory standard, it means that anything that you're producing/distributing in that area must be certified by UNBs. The whole meaning of the Q Mark is UNBS knowing your manufacturing processes, your raw materials, your storage systems, your management systems, your handling –how your employees

secure the products they're packaging. You get the Q Mark once you've satisfied UNBS that what you're churning out to the market is good for the general public. So what we're doing right now, we're mounting abrupt checkpoints on the major routes and checking compliance of goods to this regulation, we're also visiting the various distribution outlets such as the supermarkets, telling them a time is near when anything they receive from any supplier on to their shelves if it is not certified we shall remove it. So right now, we bring those who we find supplying these products whose standards are mandatory, we bring them here to the bureau and they begin the certification process. They register with UNBS if they weren't registered previously, they purchase the standard to be able to know what are the Uganda standards for what they're manufacturing, then they go through the entire process of vetting which we call the certification process. Once they satisfy that process,

QC Then what happens in the interim during that period of time, as you're handling goods found on the market without certification, while you take them through the certification process?

DA In the interim as this company undergoes the certification process, we pick samples from their products and subject them to lab analysis to see whether they miss the basic requirements, whether even before certification they're safe enough for the public to consume. Where we find goods not safe, we automatically impound and put them in our stores. I'll give an example of steel bars, in

>>>>>>>>CONTINUED ON PAGE 34

>>>>>>>>FROM PAGE 33

the process of enforcing the Q Mark we found some steel bars that were of poor standards, we decided to impound and destroy them because the repercussions adverse if leave them on the Market. So they will go through the certification process, but the goods which we found with them which are substandard will be destroyed. That's what we're doing for all, we pick samples, test and see how to proceed toward certifying them.

QC But the value chain will not have stopped at that time. Maybe you might need to stop the manufacturer, coz if they're already on the market they're still churning out, you impound those in Nakasero it doesn't mean those in Arua you've impounded too.

DA Well, it's important to note that our manufacturing sector is transitioning from informal to formal, and there a lot of government interventions that are supporting and promoting SMEs. Because we're transitioning, there's handholding that the bureau has to do to support these institutions to be able to fully formalize their operations. To get them registered alone is a big achievement. Remember previously these people have been manufacturing without anyone knowing where they even are, we were getting goods on the market manufactured in people's garages and we didn't even know where those garages were. So we're going to roll out this. It is a phased approach to enforcement of the Q Mark. We can't go forthright to clamp down on the small industries that government is again trying to support. We've

been encouraged to support them, handhold them, take them through the process, they address the non-conformity along the way as they manufacture. Closing them down until they fulfill the conditions presupposes that we're dealing with very formal institutions and that would be a de-service to all the efforts that have been put in place to support SMEs.

QC How are you going to reconcile being soft and fulfilling the standard? If their product is outright not in conformity/ doesn't meet the minimum standard requirement, wouldn't it be plausible that they first stop manufacturing until they fulfill the min. requirements?

DA For the ones where we've found outright nonconformities, for eg. Where we do the microbiology test and find a product heavily loaded with bacteria or contaminated with other external substances, for such companies we've suspended their manufacturing processes until the nonconformities have been addressed. So there are quite a number of factories we have sealed off until they have done collective action to at least fulfill the basic minimum requirement as they run rough the certification process. We're doing that, but it's on a case-by-case basis, we don't want to do it for everybody. Because they're companies that aren't certified, but their production facilities and practices are satisfactory. We just do a sampling of their products and take, because it is a requirement that they must be certified we give them time, because certification is not a one-day event, it is a

process, so while the process is ongoing they can also continue manufacturing, while observing the basic requirements for their customers.

QC So the S Mark has been phased out?

DA The S Mark is now not functional, it's obsolete. Now everybody must have a Q Mark.

QC That means even the small and Medium Enterprise manufacturers must have the Q Mark?

DA For as long as what you are manufacturing is for mass consumption, you must be certified. For as long as you're manufacturing and distributing to supermarkets, to shops, it means your product is going to be consumed by many people, it must be certified. We don't want to risk people's lives. If you're supplying only your family, preparing something at home, then perhaps you don't need certification, because they are few people at home.

QC When you look at sensitization, are all manufacturers aware that the Q Mark is now mandatory and not optional anymore?

DA I want to believe UNBS has done enough publicity. We assume the sensitization we have done –sector-wise, then in public media (newspapers, radio...) we want to believe people are aware. Even those who had not picked word from sensitization, it looks like from the operations we've conducted so far, word has gone around people are now running around, asking us 'what should we

Goods that don't conform to UNBS standards being destroyed. The UNBS surveillance team is vigilant to protect the public from harmful goods

do?' That was unheard of before. People I think never imagined that a day would come when they had to be certified.

QC So if you look at the value chain, all this is going to be considered... for example, for people in the meat-packaging industry, are you going to look at only the meat, or reach the abattoir, or go to where the cows come from..?

DA It's unfortunate that UNBS doesn't regulate the entire value chain. There are relevant ministries and departments that are handling different sectors. For example, talking of crops, when it comes to the processing of seed before it comes into harvest to be processed as food, there are institutions that should be doing regulation at that point. Similarly if you're talking about animal and animal products, there are institutions that manage the handling of animals before they're slaughtered and processed for consumption. So we

work interchangeably with other institutions, where our mandate begins is where we kick in, we don't want to commit ourselves to something that's too wide for us to manage, because of our limited capacity –going for supervision, monitoring, probably even required testing and extension work that's involved to bring up the final product.

QC This brings the question of how grounded are you in terms of the field? We have people who are manufacturing/ producing goods in hard-to-reach area?.

DA Our small numbers notwithstanding, we have regional offices in Gulu, in Mbale, in Mbarara (I'm talking about surveillance). But those teams are small, each office has one person, they have been working with the certification team. Now we're sending the surveillance from Kampala, which is comprised of about 12 people, to go and boost those teams, specifically for the Q

Mark, to try and do the impromptu checks on the vehicles, visit major outlets, do routine inspections in supermarkets, wholesales... all as we do the sensitization. Sensitization is an ongoing activity even as we try to do the enforcement. So I want to admit that we're not grounded re coverage, but we try as much as possible to launch out to major towns where we know there are centers of production –you may go to one district and there's not even a single bakery, while in another there are so many production facilities.

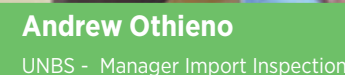

QC Talking about enforcement, are you going to do it randomly, or sector-by-sector? What's your plan like, coz as surveillance you must have a plan that 'this is how we're going to do it'?

DA Right now we're looking at food items, water and other beverages, cosmetics, processed grain, fortified foods, construction material, we're looking at items that have a high turnover, are widely consumed and are prone to abuse and could expose the general public to significant danger. If you talked of a broken chair and contaminated water, we'd run for the water first. We have our risk profiles/ parameters that we are specifically using to guide us. In the plan we have focused on 10 Most Risky Items, some of which I've told you, but that doesn't take away the mandate to address other areas, especially if they emerge and are of significance for the bureau to intervene.

QUALITY CHRONICLES

The current regulation that governs the clearance of imports in Uganda (which many people have called ‘the new regulation’) is the 2018 regulation. It replaces the 2015 one. It is actually an amendment of the 2015 Act, thereby being the most recent step in the continuous amendment of Uganda’s Import Clearance regulation (the 2015 Regulation was an improvement of the 2013 one, the 2013 regulation was an improvement of the 2011 one.

1) The need to align the current law with the ongoing realities and practices on the ground in the ever-changing business landscape of Uganda and the world.

3) The need to incorporate feedback that UNBS receives from the regulated community, so that there can be a meeting of interests on the side of the regulator (UNBS) and that of the regulated community (manufacturers,

Below are some of the key new developments which the 2018 Imports Inspection Regulation brings, as explained by Mr. Andrew Othieno (developments which UNBS believes should really benefit all stakeholders, from manufacturers, to traders, to importers, to consumers, to the country as a whole):

The new 2018 regulation introduces exemption from destination inspection for local manufacturers, something that has never been known

One of the key outcries manufacturers have been making for a long time is the long time it takes to get UNBS clearance for their raw materials, machinery, spare parts, name it. So UNBS, and particularly the Imports Inspection Department, sought a way to ease the life of the local manufacturer who is importing raw materials, industrial machinery, spare parts, that aren't

>>>>>>>>CONTINUED ON PAGE 35

>>>>>>>>>>FROM PAGE 37

for resale but for use in their manufacturing establishment registered here in Uganda.

It is mandatory by law that anyone producing any product onto the market has to undertake mandatory certification and have the Q Mark, which means the certification department engages them, audits their processes, tests their products on a regular basis – because it is on the basis of those products meeting the standard’s requirements that they are allowed to use the Q Mark, so stopping raw materials at the border which are going to undergo transformation in the manufacturing process towards final products, would be counterproductive.

The UNBS Green Lane:

Local manufacturers bringing in raw materials, industrial machinery, spare parts, are allowed free entry. The manufacturer goes on what is called the UNBS Green Lane when they reach the entry point, they are identified as a local manufacturing entity and these are raw materials/ machinery/spare parts, they go. There’s no stopping for any inspection whatsoever, all those costs associated with waiting for UNBS to take a sample, take to the lab to test, take 4 weeks, are spared.

The Green lane is to complement the URA system called Authorized Economic Operators, to enable local manufacturers easily import things they use in their production processes. Under URA’s Authorized Economic Operators system, there are local manufacturers whom the tax body has grown to trust and has concluded agreements with,

Goods at a port ready for Export

so that their goods do not stop at all at the borders, but rather go straight to their premises and URA follows them there later at its own leisure to sort their tax arrears.

The new regulation now allows UNBS to also recognize those manufacturers who deserve a ‘Green Light’ to go and start their production quickly which wasn’t the case prior to the amendment. UNBS has already drawn the first list of the beneficiaries of this; all those who are on the URA AEOs list will benefit from this UNBS Green Lane. Othieno explains that “we are going to individually conclude MOUs with them. They only have to submit to us certain information as their part of the bargain. Others will join the list as time goes on”. For any entity to benefit from this, they must be:

- 1) Registered with one of the trade associations, eg UMA, Uganda Small Scale Manufacturers’ Association.
- 2) On our certification scheme,

not be underground. Because now certification is mandatory, you must be having the Q Mark. Or if you’re new, you must have applied and be able to show us I applied and this is how far I have gone as regards acquiring the Q Mark.”

Introduces Destination Inspection Fee

Destination Inspection Fee is the other key thing that the 2018 new regulation introduces in regard to imports inspection, something that wasn’t in all the previous regulations.

Previously the traders going through PVOC (Pre-shipment Inspection) were paying an Inspection Fee before shipment of their goods while those wouldn’t do PVOC out there but come and do Destination Inspection here were not paying anything for their inspection,” Mr. Othieno explains. “Now that was an unfair trade setting, and the traders who underwent PVOC were actually complaining of unfair treatment. It

was also causing those who would have done PVOC to say, ‘I’ll go and do destination inspection, since there’s no fee,’ yet the Law says you must do PVOC if the value of your consignment is worth more than USD 2,000 and it has a mandatory standard. Also, we’re members of the World Trade Organization (WTO), and in that the agreements we have signed with WTO are very clear, that there must be consistent and equal application of the law, in respect of goods that are either being imported or exported, what you do the other side you must also do here. Actually we should have been taken to the WTO Tribunal because for a number of years we were levying an Inspection Fee the other side under PVOC, yet here at Destination Inspection there were no fees. So to bring our regulation into harmony with the WTO requirement, we now introduced this Destination Inspection Fee, which is equal. It is another WTO rule that you can’t have a different fee out there for PVOC and a different fee here for Destination Inspection. So Destination Inspection Fee is a timely and needed introduction.

Introduces a Threshold to which goods are inspected.

The old regulation was blind to the value of goods being imported. It was coached in such a manner that whatever thing of value a person happened to be importing, so long as it had a mandatory standard, you had to undergo UNBS intervention.

The regulation then was short-sighted, the way it was written –just saying as long as it was

a product with a mandatory standard it had to be tested by UNBS. We were getting many such cases. We also had other cases where the cost of sample testing would be the same cost as that of the goods brought in. For example, the cost of testing shoes is over sh1 million. And we have many other goods where the cost of testing is higher than the cost of the goods themselves. So that was unfair trade, unfair regulation. Explains Othieno

“What this new regulation is bringing in is a threshold to which imports are subjected to UNBS scrutiny. It’s been set at USD 1,000, coz in our understanding anything less than USD 1,000

you’re bringing it in for personal consumption, things like tyres for cars. Anything less than USD 1,000 UNBS will not intervene, unless it is a product that’s deemed to be very high risk, emphasis being on ‘very’.

Spells out high-risk items

The new regulation elaborates items that are under the category of ‘high risk’. It is within the wording. While setting a threshold, it clearly states that With the exception of: food, baby products and cosmetics, to indicate these are exceptions to the rule. These must be inspected even when they fall below the threshold. Food, because goes into people’s

>>>>>>>>>>CONTINUED ON PAGE 39

T: +256-414-568-800 / 01 | E: info@panafricimpex.com | www.panafricimpex.com

bodies. Baby products, because babies will put anything into their mouth. Cosmetics, for obvious reasons.

Clearly defines raw-materials

The new regulation, according to Mr. Othieno, also clearly defines raw materials, which definition is very helpful in helping UNBS deal with those people who would like to cheat by presenting imports as raw materials when they are simply final goods that they are going to put on the market once in the country.

“We define raw materials very specifically in our regulation,” says Mr. Othieno. “Raw materials are products that are to be used in the manufacturing process, so they’re products which are to undergo physical change (‘undergo transformation’) in the production process. So if you’re bringing in iron sheets they’re not raw materials. If you’re bringing tiles, they’re not raw materials. The key word is actually ‘Transformation.’ People who bring here big rolls of toilet paper and they cut, they’re not the type of investors we want or are encouraging, so going by our definition their imports don’t qualify to be treated as raw-materials at the border. What jobs are they bringing? For people just to cut? As UNBS we aim to encourage people who will employ our industrial chemists, food scientists who are graduating from Makerere and other universities...not people who just repackage imports. So the new regulation’s defining of raw materials is very vital.”

It incorporates the move from manual to electronic operation

“The previous regulations (2015, 2013 and others before) were speaking to a manual process,” Mr. Othieno says. “You’d find statements like: ‘As the procedure to get imports clearance, the importer has to manually fill an Imports Request for Clearance form.’ But now we have moved from being a department that was primarily manual, to one that is largely electronic, one that is on the Electronic Single Window system. The new regulation takes that into consideration by trying to speak to the electronic processes we operate with now.”

“Now the importer no longer applies to UNBS at all for Inspection Clearance, rather the act of submitting his declaration to customs (URA) doubles as the application to UNBS. If it is a commodity that’s of interest to UNBS, the system will automatically involve UNBS, by pushing that to our E-portal, because we’ve built into the Customs system and whatever is of interest to UNBS being automatically given us. Once one fills in the declaration to customs for clearance, they indicate the goods they’re importing, value, from where etc, the very information we would ask them to manually fill in with UNBS again, the system automatically sends it to UNBS. So you can see that we needed to rewrite the way this regulation works, taking into account the changes that have come with going largely electronic.”

Harmonizes/Clarifies PVOC within the region

The EAC arrangement is that a country notifies only one mark, and only goods with that notified mark will have free entry to regional markets, those bearing other marks which aren’t the notified mark won’t get that free entry. A country like Kenya has 4 marks, but it is the Standardization Mark that it has notified. So if a Kenyan product comes to the Ugandan border with the Kenyan Diamond Mark, it doesn’t get free entry. It is only Kenyan goods that come with the Standardization Mark that get recognition and are considered already certified to enter the Ugandan market.

“As Uganda we previously had two marks, the S and the Q Mark. But it’s the Q Mark we notified to the EAC in Arusha as the Mark which should give Ugandan goods free access to East African markets. So if anyone tried to export to Tanzania with the S mark, the product wouldn’t be recognized as already certified –it would have to undergo inspection and gain certification at the border. Good thing is now we have only one mark in Uganda, the Q Mark, which is the one we have notified to the EAC, and it means once you have the Q Mark and are qualified to put your product on the Ugandan market, you have also qualified to put your product on the entire EAC market.”

QUALITY PROPELS CROWN BEVERAGES INTO MARKET LEADERS!

Crown Beverages is one of Uganda’s leading beverage manufacturers. This is primarily because of its strict adherence to both local and international standards. The Quality Chronicles magazine caught up the its Quality Assurance Mugerwa Willy who gave an account on what has led to this success

Crown Beverages (Pepsi Cola) has a quality policy, briefly please take us through what your quality policy is?

Our quality policy is hinged to meeting local, statutory and international standards, we are currently undergoing a phase of food safety systems certification, which will further re-assure our confidence to consumers that Crown Beverages is indeed interested in continuing to produce goods that meet quality. Basically one of the major aspects of our quality policy is to ensure that we manufacture and handle drinking water, Carbonated Soft Drinks (CSDs) and of late food packaging material like pre-forms a raw material for the bottles.

You have a value chain as Crown Beverages, where does it start and where does it end?

Quality is made into a system, right

from inspection of raw materials, to subsequent management of processes in bottling lines to double treatment of our major ingredient, water. We have a commitment to our consumers to manufacture products that meet international standards. We have a water safety plant that helps us manage our water and its different sources, currently we are upgrading our water treatment system which delivers about 90m3 of water per hour prior to 60m3 per hour, and this has enabled us to meet our production demand. To ensure consistence in quality we abide by requirements of both local and international regulators and audits, for the local we go through Uganda National Bureau of Standards (UNBS) certification schemes requirements, for international we go through a third party auditor called the American Institute of Bakery where we undergo an extensive food safety audit that looks at process, people, facility and products. It has been a journey along the chain from the yellow mark, green and now blue which is the highest. For three years now we have attained the blue mark and since 2004 we have been obtaining the highest score on food safety.

Pepsi Cola are one of the market leaders in the region, how has the quality policy

helped you maintain the huge market share?

To be a market leader especially in the food sector does not come by accident, we deal with perceptions and expectations of our consumer public, and for us to remain in the lead we have done certain things that our consumers do not find in a lot other products, this gives us an edge against competition. We have engaged in a lot of campaigns to create awareness, we do a lot of Corporate Social Responsibility, got involved in the Rotary Cancer Run, we are also involved in projects that support football. Currently we

>>>>>>>>>CONTINUED ON PAGE 42

are running a campaign called TUKONNECTINGE where one can acquire a car by just drinking a soda, this has changed people's lives.

Has UNBS played a role in anyway in your value chain and quality policy, briefly explain how this has helped you establish quality as Crown Beverages.

Previously we viewed UNBS as FBI, now they are partners because we have moved this journey together. The regulator has created awareness to both staff and management about standardization and requirements like how to create safe standardized products, what products can be put on the market, how to meet legal, operational requirements to mention but a few. To maintain the lead in production of safe and quality, there is a quarterly sample submission plan that UNBS requires we comply with and apparently there are no bad findings.

It's not a smooth road, what have been the challenges so far?

At the start, we used to have a very small lab with two glass lines, but currently we have three glass lines and three PTIs which is a lot of production capacity. As a company we want to move faster but at times UNBS slows us down, because our new products have to meet a standard test.

Other facilities have also grown to match up the growing production needs like the testing facilities have grown sizeably, our analytical lab is now considered one of the biggest in Uganda,

One of Crown Beverages Standardized Production Line

we have a well-equipped micro biology lab to do internal testing, we have an independent raw material testing lab, we also have an independent state of the art PET testing laboratory which can do all tests on site, we also have an independent PET testing lab, where we do testing of pre-forms that we manufacture on site, in fact we intend to enroll for laboratory accreditation with UNBS.

With the trend of packaging, there are few concerns about Polyethylene terephthalate (PET), which measures have you taken to ensure the product is not affected?

Crown Beverages has what we call a hazard analysis plan (HASP), which looks at potential hazards, we evaluate those hazards, assess them, suggest control measures, implement them and then review them for effectiveness. For example during the blowing of bottles there is a gas called acetaldehyde this is a chemical which is associated with causing cancer in some levels, part of our critical tests in our PET lab is the acetaldehyde test, once plastic goes out of range and over heats, there is potential

raise of acetaldehyde, but we set our machines in a way that once temperatures exceed 170c and yet you have set 60c it goes off automatically, We also submit samples to external laboratories, to ensure that we are in control. There should not be cause of alarm, because PET is the future.

There is a lot environmental concern, do you have any policy to deal with environmental degradation?

We have in place a waste management program in house, when bottles are generated they are subcontracted in the greener jobs, we also do sub contracts to collect for recycle, papers, polythene bags to mention, this has become another source of income. We also have partnerships with Clean up Uganda an organization that deals in awareness to prevent poor waste management, we also recycle waste from Coca Cola. We have plans with other stake holders to make sure we handle our waste better. On our label we have a logo that shows our commitment to waste management.

Bottles go directly to the filler after being made

OPP Labeller Machine

EASY, STABLE AND DURABLE

See how **MATICLINE Combi-line** works : check the link https://youtu.be/pCrS_MCDNz4 or just search "MATICLINE" on YouTube.

MATICLINE Combi-line combines the PET plastic bottle making and water packaging into one **fully automatic** production line. It improves noticeably the hygiene and appearance quality of the produced bottled water, therefore increasing the product's popularity and market sustainability. And less labor, less trouble.

"To differ or die." --- Al Ries and Jack Trout (FMCG Marketing Gurus, authors of "Positioning")

MATICLINE Combi-line enables you to produce your own **UNIQUE** shaped bottles with your personal brand identity, for example a brand featuring your local culture, therefore differentiating your products easily from others. And we offer the unique packaging designs free of charge to our respected clients.

Our successful
clients in Africa

SKY Saafri la Vie Classy

Price of a complete start-up plant: 150,000-300,000 USD up. (Production Output: 2000-3500 Liter per hour. Bottles volume ranges from 300ml up to 2000ml)
(We accept any penalty if our lines failed in satisfactory production!)
